HIGH VISIBILITY STANDARDS

ANSI/ISEA 107-2020 STANDARD:

The American National Standard for High-Visibility Safety Apparel is a standard established by American National Standards Institute, Inc (ANSI) and the International Safety Equipment Association (ISEA). Numerous workers, including construction, utility, police, emergency medical services, fire fighters, road workers, flaggers, and airport ramp workers are routinely exposed to the hazards of low visibility while on the job. This standard provides guidelines for the selection and use of high-visibility safety vests to improve worker visibility during the day, in low-light conditions and at night.

ANSI/ISEA 107-2020 Type R, Class 2:

Type R HVSA provides high visibility protection for workers who require greater visibility under inclement weather conditions, when backgrounds are complex and when tasks divert attention from traffic. Background Fabric: 775 Square Inches (540 Sq In - Small Sizes) Reflective Material: 201 Square Inches Minimum Reflective Width: 1.37 Inches

ASTM F1506 Inherently Flame Retardant Material:
ASTM F1506 uses vertical flame test ASTM D6413 to determine flammability.

- Fabric must self extinguish in less than 2 seconds after flame has been removed.
- Char length must be less than 6 inches.
- No melting or dripping can be observed.

ANSI/ISEA 107-2020 Type R, Class 3:

Type R HVSA provides high visibility protection for workers who require greater visibility under inclement weather conditions, when backgrounds are complex and when tasks divert attention from traffic. Background Fabric: 1240 Square Inches (1000 Sq In - Small Sizes) Reflective Material: 310 Square Inches Minimum Reflective Width: 2 Inches

Standard Performance Specification for:
Apparel for use by Electrical Workers exposed to momentary electric arc and related thermal hazards.

ASTM F1506 was developed for fabric intended for NFPA 70E standards and applications requiring arc rating greater than 4.0 cal.

NFPA 70E Hazard Risk Category Levels:

CAT level is determined by the minimum amount of calories per square centimeter (ATPV or Cal/cm²) a treated garment must pass through with a 50% probability of a 2nd or 3rd degree burn occurring, thus the protective level of the treated clothing. The higher the ATPV, the higher the CAT level attained, the greater the protection.

Hazard Risk Category	Common FR clothing at this level	Min ATPV(Cal/cm ²)
CAT 1	FR shirt and FR pants; or FR coveralls; Single base layer of FR protection	4
CAT 2	FR under garments (undershirt, underwear), FR shirt, and FR pants; FR under garments, FR coveralls; 2 or more layers of FR protection	8
